1 ABSTRACT OF THE DISCLOSURE

2 A female receptor for locking a male plug and having aⁿ
3 actuator element accessible from an exterior position. The
4 actuator element comprises an elongated shaft having an area of
5 reduced width to permit disengaging movement of internal balls
6 mounted in the receptor body. The ball and balls retain the
7 prongs of the male plug in place when the area of reduced width
8 of the rod is not aligned with the ball and balls.
